

## FOR IMMEDIATE RELEASE

### Fire Suppression System Protects Remote Sites Without Electricity

An automatic fire suppression system that rapidly detects and suppresses fires inside remote communications and antenna cabinet sites without electricity is available from Firetrace<sup>®</sup> International of Scottsdale, Arizona.

Firetrace<sup>®</sup> Automatic Fire Suppression Systems for remote sites are designed for equipment cabinets up to 250 cu. ft. and feature a flexible, polymer tubing which can be routed anywhere inside. Armed with from 3 to 20 lbs. of fire suppression agent, when the proprietary tubing is exposed to a flame, it automatically ruptures and instantly dispenses all of the fire suppression agent without requiring electricity or any other external power source.

Ideally suited for detecting and suppressing internal fires caused by short circuits and overheating, Firetrace<sup>®</sup> Automatic Fire Suppression Systems are capable of discharging user-specified, clean fire suppression agents such as FM-200<sup>®</sup> and CO<sub>2</sub>. Systems can also be configured to signal and communicate with other devices.

Firetrace<sup>®</sup> Automatic Fire Suppression Systems are priced according to type of suppression agent, cylinder size, and tubing requirements. Literature and price quotations are available upon request.
